

Global Warming

A shocking report says every search on a search engine generates carbon-dioxide. Global warming is silently extending its territory in our lives. Industries, transport, conventional electricity, oil and gas, etc. continually keep increasing earth's temperature. Respiratory disorders, extreme climate, and food chain disruptions are raising a question: "Are we doing justice to our future generations?"

The developed countries which have passed through a fast phase of development, object to activities meant for economic progress of developing and underdeveloped nations. It is unfair. For a real effort to fight global warming, the developed nations must help other nations with going green.

The greenhouse gases like Carbon-di-oxide, chlorofluorocarbons, etc. trap the solar heat in the atmosphere and thus the temperature of the earth continues to rise. It rises slowly but regularly. Its most dreadful apprehensions are rising sea level, risk of famines and jungle fires, new diseases, etc.

We must understand that firstly we need a collective force to fight this menace. Let us plant trees, do better waste management, rid ourselves of the use of plastic, and stop other activities leading to air pollution. Secondly, this needs a consistent effort. Climate change happens every second. So should be our efforts.

We must remember that global temperature rises consistently. So, we must be on our toes every moment to fight this menace. Our collective effort and alertness can cause miracles. Let us vow to ourselves that we shall not indulge in activities that help global warming.
